                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  control of the promoter and the ON sequence when the ON is bound by a STAT protein activated in response to II-2, II-3, G-CSF, GM-CSF, erythropoietin, thrombopoietin, or preferably II-4, II-7, II-9, II-13 or II-15. Cytokine responsive host cells transfected with the DNA construct can be used to measure the ability of a compound to act as an agonist or antagonist of cytokine mediated gene transcription. In particular, they can be used to screen for cytokine modulators involved in the STATS and/or STAT6 protein
                                                                                                                                                                                                                                                                                                                                                                              Claim 7; Page 125; 135pp; English.

The present oligonucleotide comprises a regulatory element TT(Nx)AA, where x is 4-7, and the regulatory element binds an activated transcriptional regulatory protein in response to a signalling mol., i.e. a cytokine. This cytokine responsive DNA spacer regulatory element can be used to detect the presence of a transcriptional regulatory protein in a sample, and in assays
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    sample

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Disclosure; Page 34; 95pp; English.

Comparison of the invention. The construct is a mammalian contributed in the DNA construct of the invention. The construct is a mammalian contributed in the DNA construct of the invention. The construct is a mammalian contributed in the DNA construct, and comprises a mammalian telomere and a comprise in a mammalian telomere and a comprise in the CENP-B box sequence. The invention also relates to methods for the CENP-B box sequence. The method can be used to construct, modify conficiently in an introduced into mammalian cells. The MACs can be used to construct, modify can atably maintain YACs in yeast cells which have the ability to form CMACs when introduced into mammalian cells. The MACs can be used for basic studies on cryanisation and function of mammalian cells. The MACs can be used for basic studies on cryanisation and function of mammalian chromosomes and also as a vector to introduce DNA segments (genes) of interest to test their functions in the subject to variable expression due to integration position effect nor cause unpredictable insertion mutation on host chromosomes. Furthermore CMACs will have the capacity to accommodate a DNA segment up to megabases where an entire large gene or group of genes and regulatory elements could be included. The MACs can be used for somatic gene therapy or to construct transgenic mice.
PT DNA constructs containing cytokine-responsive regulatory elements -
PT useful in assays for transcription-regulating proteins or gene
PT transcription agonists or antagonists
PS Example 1; Column 19-20; 58pp; English.

CC V5882-V56976 and V61601-V61631 are oligonucleotides used in the
PS element linked to a promoter which is linked to a heterologous coding
CC element linked to a promoter which is linked to a heterologous coding
CC element linked to a promoter which is linked to a heterologous coding
CC element of that the coding sequence is under the transcriptional control
CC of the regulatory element and the promoter, where the regulatory element
CC of the regulatory element and TTCNNGAA, TTANYTAA, and TTCNYTAA
where N is A, T, C or G, and y = 3 or 4. The constructs can be used to
CC where N is A, T, C or G, and y = 3 or 4. The constructs can be used to
CC where N is A, T, C or G, and y = 3 or 4. The constructs can be used to
CC where N is A, T, C or G, and y = 3 or 4. The constructs can be used to
CC where N is A, T, C or G, and y = 3 or 4. The constructs can be used to
CC where N is A, T, C or G, and y = 3 or 4. The constructs can be used to
CC where N is A, T, C or G, and y = 3 or 4. The constructs can be used to
CC where N is A, T, C or G, and y = 3 or 4. The constructs can be used to
CC where N is A, T, C or G, and y = 3 or 4. The constructs can be used to
CC where N is A, T, C or G, and y = 3 or 4. The constructs can be used to
CC where N is A, T, C or G, and y = 3 or 4. The constructs can be used to
CC where N is A, T, C or G, and y = 3 or 4. The constructs can be used to
CC where N is A, T, C or G, and y = 3 or 4. The constructs can be used to
CC where N is A, T, C or G, and y = 3 or 4. The constructs can be used to
CC where N is A, T, C or G, and y = 3 or 4. The constructs can be used to
CC where N is A, T, C or G, and y = 3 or 4. The constructs can be used to
CC where N is A, T, C or G, and y = 3 or 4. The constructs can be used to
CC where N is A, T, C or G, and y = 3 or 4. The constructs can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

PI DRA construct for screening modulators of cytokine-mediated promoter operably linked to a heterologous gene promoter operably linked to a heterologous gene Seample 1; Page 26; 72pp; English.

CC A novel DNA construct comprises the present oligonucleotide (ON), CC which contains a core a regulatory element, operably linked to a cc promoter, which is operably linked to a heterologous gene CC (preferably a marker gene). The gene is under the transcriptional CC control of the promoter and the ON sequence when the ON is bound by CC a STAT protein activated in response to II-2, II-3, G-CSF, GM-CSF, CC II-13 or II-15. Cytokine responsive host cells transfected with the CNA construct can be used to measure the ability of a compound to act as an agonist or antagonist of cytokine mediated gene CC cytokine modulators involved in the STAT5 and/or STAT6 protein control of the protein in particular, they can be used to screen for cytokine modulators involved in the STAT5 and/or STAT6 protein
                                                                                                                                                                                                                                                                Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   resulting complex. The cells can be used in screening assays for agonists of gene transcription, in which the level of expression of the coding sequence is measured in the presence and absence of a test compound or in the presence of the corresponding cytokine.

Sequence 19 BP; 6 A; 4 C; 5 G; 4 T;
                                                                                                                                                                                                                                                                                                                      signalling pathway. Following an electrophoretic mobility shift assay was found to bind IL-4 and IL-13 moderately. Sequence 19 BP; 4 A; 5 C; 4 G; 6 T;

Example 5; Page 33; 48pp; English.

The primers given in Q91526-27 were used for the analysis of the ETS-2 MspI PCR-RFIP. Restriction patterns of PCR products were compared to detect the polymorphism.

CC The invention relates to a human phosphomannomutase-2 (PMM2) protein and CC the nucleotide sequence encoding the protein. The DNA or its fragments care used to detect mutation in the PMM2 genes that are associated with CC sequences can also be used to detect expression of PMM2-related cDNA; to CC express PMM2 or its mutants; and to create transgenic animals for use in CC drug screening and for studying expression pathways. The expressed CC proteins are used to screen for agents that modulate activity of PMM2, for therapy and to raise specific antibodies (for detecting PMM2 or its mutants, in competitive or capture assays). Blochemical assays for CC cutants, in competitive or capture assays). Blochemical assays for CC phophomannomutase activity are used to identify possible carriers of CDG1 (Jaeken disease). Measuring enzymatic activity in foetal cells (or in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

The present sequence was used in the development of a novel assay for a putative regulator of cell cycle progression. The assay comprises expressing in a cell a protein comprising the E region and sufficient C-terminal residues of a DP-3 protein to provide a functional nuclear localisation signal (NLS), or the NLS of E2F-1, and a marker for nuclear localisation. Then the degree of nuclear localisation. Then the degree of nuclear localisation in the presence and absence of the putative regulator is determined. Regulators identified using the assay can be used as potential regulators of cell proliferation, or as models for rational drug design. Regulation of the NLS may lead to effects such as enhanced cell division, blocking of cell cycle progression or apoptosis. The regulators may also be used to design other
                                                                                                                                                                                                                                                                                                                                             05-NOV-1998.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        မှ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Production of polynucleotides with desired properties - by iterative presentation and recombination products were used to introduce mutations into the TEM-1 pck primars V54900-14 were used to introduce mutations into the TEM-1 betalactamase gene. The PCR products were used to construct muatnt combinantions of the gene, using the method of the invention. The specification describes a method for evolving a polynucleotide for acquisition of a desired property. The method comprises providing a population of variants of the polynucleotide, at least one of which is in cell-iree form, shuffling the variants of the polynucleotide to form recombinant polynucleotides, selecting or screening for recombinant colynucleotides, selecting or screening for recombinant polynucleotide have evolved toward the desired property and repeating the steps with the selected recombinant polynucleotide has acquired the desired property. The recombinant polynucleotide has acquired the desired property. The can be formulated as a pharmaceutical.

                                                                                                                                 PT New isolated nucleic acid segments from the human genome - used for pridetermining polymorphic forms for use in e.g. forensics, paternity pri testing or phenotypic typing for disease ps. Claim 16; Page 202; 310pp; English.

Claim 16; Page 202; 310pp; English.

CC sucolation of various biallelic polymorphic markers found in the human cc genome (represented in x10269-x12937). These primers can be used in a genome (represented in x10269-x12937). These primers can be used in a cc forensics, paternity testing or for phenotypic typing for diseases such as agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Aldrich syndrome, Fabry's disease, familial cc hypercholesterolemia, polycystic kidney disease, hereditary hypercholesterolemia, polycystic kidney disease, hereditary chaemorrhegic telangiectasia, familial colonic polyposis, bheres Danlos conditions, osteogenesis imperfecta, acute intermittent porphyria, caucinamune diseases inflammation, cancer, diseases of the nervous creation by pathogenic microorganisms, and characteristics such cas longevity, appearance (e.g. baldness, obesity), strength, speed, cendurance, fertility, and susceptibility or receptivity to particular drugs or therapeutic treatments. The isolated polymorphic nucleic acid cagments can also be used to produce medicaments for the treatment or recombinates of such diseases.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               surveillance 1 alpha and beta proteins - useful for identifying modulators and inhibitors for treating, e.g. ataxia telanglectasia Example 2; page 25; 212pp; English.

Primers oDH23 (T72674) and oDH26 (T72679) were used to amplify a portion of the human mammalian cell cycle surveillance 1 (MCCS1) gene. Primer oDH26 is based on the MCCS1 alpha cDNA sequence (see also T72664). The primers were used in a PCR-based assay to map the MCCS1 gene to human chromosome 3. A 237 bp product was generated from a human/rodent chromosome 3 hybrid. In a second set of amplification reactions, the same primers were used to sublocalise the MCCS1 gene to the interval between q21 and q25.1 of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             05-NOV-1997; U20313.

Example 1; Page 4; Spp; German.

Methods for detecting antibodies directed specifically against human papilloma virus (HPV) proteins are claimed. In particular, the method is used to detect uncontrolled expression of the HPV E6 and E7 genes to provide early diagnosis of HPV-associated cancers, especially cervical and oral carcinoma. A HPV protein is bound to a carrier and is then incubated with a sample such that any anti-HPV antibodies become bound. The immobilised antibodies are detected, either directly or indirectly, by reaction with an anti-idiotype antibody. In a specific example, the HPV 16 E7 protein was fused to a C-terminal sequence of 11 amino acids from the SV40 T antigen for immobilisation.
                                                                                                                                                                                                                                                                         Wales R
WPI; 97
Primers IFN-beta REVERSE (T84431) and IFN-beta CRC FORWARD (T84432) are based on the pig interferon-beta (IFN-beta) gene. They can be utilised in an internal standard PCR amplification of pig genomic DNA, simulataneously with primers (see T84420-27) specific for the pig KIT gene. DNA amplified from pig genomic DNA by the KIT gene
                                                                                                                                            Determn. of coat colour genotype in pigs by analysis for duplication or deletions, or analysis of KIT prestablish breeding programmes for pigs of selected coclaim 12; Page 39; 49pp; English.

Claim 15 and 38; Page 46; 177pp; English.

The sequences given in Q47433-44 are primers which were used in the quantification of human GTP binding protein (G protein)-specific mRNAs. These primers are derived from human and rat G-protein sequences. These primers were used in conjunction with the method of the invention, in PCR, for the detection and quantification of mRNAs in a sample without the need to purify the mRNA from cells. The claimed method comprises identifying a polynucleotide sequence unique to the mRNA, and immobilising an oligomer complementary to this

The 3 alleles for pig coat colour (I, inhibition of coat colour; I(p), patch; and i, development of colour) can be differentiated on the basis of duplication/deletion in the KIT gene. This allows breeding of pigs with the desired, usually white, coat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (HITB ) HITACHI CHEM CO LTD.
